PROFESSIONAL SUMMARY

Data Analyst with 3+ years of experience applying Python, SQL, and structured analytical frameworks to uncover trends, ensure data integrity, and communicate findings clearly across fintech, healthcare, and operations domains. Currently at Stratum Core Systems Inc. performing independent validation, reporting, and output documentation on analytical runs, combining Python scripting for automated data checks with precise written reporting for executive stakeholders. Experienced processing datasets ranging from 600,000+ financial transactions to 110,000+ healthcare records with a consistent focus on accuracy, reproducibility, and clarity. Proficient in Python, SQL, Power BI, Tableau, XGBoost, and SHAP.

TECHNICAL SKILLS

Programming & Databases:	Python (Pandas, NumPy, Scikit-learn, XGBoost, SHAP, TensorFlow, Neural Networks), SQL (PostgreSQL, MySQL, CTEs, Window Functions, Query Optimization)
Data Analysis & Modeling:	Exploratory Data Analysis, Data Cleaning & Transformation, Anomaly Detection, Statistical Analysis, Hypothesis Testing, Feature Engineering, Time-Series Forecasting, A/B Testing
Visualization & Reporting:	Power BI, Tableau, Excel (Advanced Formulas, PivotTables, Macros), Streamlit, Matplotlib, Seaborn
Tools & Platforms:	Jupyter Notebooks, Git, GitHub, Google BigQuery, Supabase, ETL Processes, Data Documentation

PROFESSIONAL EXPERIENCE

Data Analyst

April 2026 – Present

Stratum Core Systems Inc. — Lagos, Nigeria (Full-time, Remote)

- Conducted independent validation of analytical signal runs against a structured gate framework, producing formal validation records and gate decisions on each run.
- Caught and formally recorded critical admissibility violations in analytical outputs, including denominator miscalibration, unapproved confidence classifications, and cohort boundary breaches, with findings requiring executive review and corrective reruns before outputs could be accepted.
- Uncovered cohort contamination issues in signal outputs and produced formal edge-case treatment documentation; independently reproduced all signal computations from raw outputs before recording any gate decision.
- Escalated undisclosed distortions where execution-side confidence assessments were contradicted by evidence present in the same output package; no finding submitted without independent verification.
- Translated complex Python and SQL output findings into precise, unambiguous written reports for non-technical decision-makers, covering gate verdicts, failure root causes, and rerun recommendations.
- Traced a governance-blocking dataset hash discrepancy across three pipeline versions to its structural root cause, distinguishing genuine data corruption from cosmetic schema and formatting drift, and drove adoption of a new permanent input-identity control after existing checks were shown unable to detect it.
- Built reusable Python audit tooling, including file-integrity hashing, schema diffing, manifest reconciliation, and statistical equivalence testing across hundreds of time-series data points, to independently verify multi-round correction packages rather than relying on execution-side self-reporting.

Data Analytics Consultant (National Service)

January 2025 – December 2025

Government Technical College — Osogbo, Nigeria

- 3 regression models constructed to quantify the relationship between attendance and academic outcomes across 120+ student records, supporting data-driven instructional planning.
- 15% improvement in class average achieved by creating a performance monitoring framework tracking 15 academic indicators, enabling early detection of at-risk students.

Digital Community Growth Analyst

January 2022 – January 2023

Freelance (Remote)

- 71,500+ members tracked across 2 online communities via DAU/MAU ratios and retention metrics; findings compiled into Excel dashboards for stakeholder reporting.
- 4 A/B experiments designed and evaluated to optimize content timing and format using statistical significance testing, informing platform-wide scheduling decisions.
- 25% increase in community participation generated by recommending data-backed improvements to content scheduling, posting format, and event structure.

Quality Assurance Analyst

June 2021 – October 2021

Archy Pharmaceutical Company — Lagos, Nigeria

- 200+ pharmaceutical batch tests monitored via statistical process control charts, maintaining 100% GMP compliance and flagging 15+ out-of-spec patterns before escalation.

Inventory Analyst & Demand Forecasting Specialist

March 2020 – January 2021

Preplus Supermarket — Lagos, Nigeria

- 30% reduction in product stockouts and 15% improvement in inventory turnover achieved by constructing time-series demand forecasting models across 500+ SKUs.
- 40% cut in manual purchasing review time by automating reorder triggers based on forecasted demand thresholds.

DATA ANALYTICS PROJECTS

Fintech Transaction Intelligence & Merchant Risk Analysis

Python, SQL, XGBoost, SHAP, Streamlit · github.com/Ethminer001/fintech-merchant-intelligence

- 600,000+ financial transactions analyzed across 5,000 merchants representing NGN 26.3B in platform volume, surfacing fraud patterns and merchant risk segments through structured scoring.
- 40+ fraud detection features engineered including transaction velocity, chargeback frequency, and behavioral patterns; SHAP applied to explain model predictions and surface top risk drivers.
- 973 high-risk merchants (19.5% of portfolio) traced via XGBoost model, documented in a 4-page interactive Streamlit dashboard for non-technical stakeholder exploration.
- 23 SQL queries crafted using CTEs, window functions, Z-score anomaly detection, and NTILE segmentation to establish behavioral benchmarks across the full merchant dataset.

The Last 40 Million — Statistical Drivers of Financial Exclusion in Nigeria

Python, statsmodels, SciPy, Pandas, Matplotlib · github.com/Ethminer001/the-last-40-million

- 26,930 Nigerian adults analyzed across 6 inferential statistical modules, with every analytical decision documented in a structured methodology framework.
- 34x exclusion odds ratio quantified for adults with no formal education vs university graduates (OR = 34.15, 95% CI [27.85, 41.88]) after controlling for region, income, sector, and gender.
- Corrected a female-skewed income selection bias across 4,924 respondents; ambiguous categories recoded rather than dropped to preserve data integrity.
- 14-page findings report published covering logistic regression (McFadden $R^2 = 0.2590$, 26,361 observations), chi-square hypothesis testing, and Cramer's V effect size hierarchy.

Patient Retention & No-Show Prediction — Healthcare Analytics

Python, SQL, Random Forest, XGBoost · github.com/Ethminer001/patient-retention-analysis

- Ensemble model built on 110,527 medical appointment records using Random Forest and XGBoost, achieving 72% ROC-AUC for patient no-show prediction.
- 62,299 patients segmented into risk tiers, enabling targeted scheduling interventions and SMS outreach for high-risk cohorts.
- Surfaced that patients under 30 and appointments booked 30+ days out carried significantly elevated no-show rates, reshaping provider outreach timing strategy.
- \$2.37M in projected revenue recovery modeled by preventing 13,000+ annual no-shows through optimized scheduling and retention programs.

EDUCATION

Bachelor of Science — Biochemistry

Graduated August 2024

Federal University Oye Ekiti (FUOYE) — Ekiti, Nigeria

CERTIFICATIONS

Supervised Machine Learning: Regression & Classification — DeepLearning.AI / Stanford University (Coursera)

March 2026

Advanced Learning Algorithms — DeepLearning.AI / Stanford University (Coursera)

July 2026

Understanding and Visualizing Data with Python — University of Michigan (Coursera)

April 2026

Data Analytics Job Simulation (Tableau, Excel, Forensic Analytics) — Deloitte via Forage

February 2026
